

Synthesis B Light

Tom Price

Synthesis is the study of a dialogue between two contrasting materials – resin and tar – and their negotiation for space and identity when forced to become a single unified entity.

Petal-like cracks and fissures formed through a careful manipulation of the catalysing process of the resin cluster and interact with amorphous invasive bodies of tar, which loom – apparently suspended in space. The tar initially appears densely black, almost light-absorbent, but upon closer inspection, a network of fine green vapour trails can be seen drifting from a surface partially melted by the exothermic reaction of the curing resin. As the tar heats it expands, searching for pathways within the resin and
